Outline

- Convex function
- Equivalent characterization
- Examples of convex function
- Properties of convex function
- Convexity-preserving operations

Convex function

A function $f: \mathbb{R}^n \rightarrow \mathbb{R}$ is **convex** if **dom** f is a convex set and for all x, y , and $0 \leq \theta \leq 1$:

$$f(\theta x + (1 - \theta)y) \leq \theta f(x) + (1 - \theta)f(y)$$

Function lies below the line segment between $(x, f(x))$ and $(y, f(y))$.

Strict convex : for all $x \neq y$, and $0 < \theta < 1$:

$$f(\theta x + (1 - \theta)y) < \theta f(x) + (1 - \theta)f(y)$$

A function f is concave if $-f$ is convex.

Examples

- Univariate function:
 - Exponential function $f(x) = e^{ax}$, for any a
 - Logarithmic function $f(x) = \log x$ over \mathbb{R}_{++}
 - Quadratic function $f(x) = ax^2 + bx + c$, $a > 0$
 - Power function $f(x) = x^a$ is convex for $a \geq 1$ or $a \leq 0$, and is concave for $0 \leq a \leq 1$.
- Affine function: $f(x) = Ax + b$
- Quadratic function $f(x) = x^T Qx + q^T x$, where $Q \succcurlyeq 0$
- Squared loss $f(x) = \|Ax - b\|_2^2$ ($A^T A$ is always positive semidefinite)
- Norm: $\|x\|_p \triangleq (\sum_{i=1}^n |x_i|^p)^{1/p}$, where $p \geq 1$

First-order characterization

Suppose f is differentiable. Then f is convex *if and only if* $\text{dom } f$ is convex and $f(y) \geq f(x) + \nabla f(x)^T (y - x)$, for all $x, y \in \text{dom } f$.

$$\nabla f(x) = \begin{bmatrix} \frac{\partial f}{\partial x_1} \\ \frac{\partial f}{\partial x_2} \\ \vdots \\ \frac{\partial f}{\partial x_n} \end{bmatrix} \in \mathbb{R}^n$$

First-order approximator underestimates f

Second-order characterization

Suppose f is twice differentiable. Then f is convex **if and only if** $\text{dom } f$ is convex and its Hessian matrix is positive semidefinite:

$$\nabla^2 f(x) \succcurlyeq 0, \text{ for all } x \in \text{dom } f.$$

$$\nabla^2 f(x) = \begin{bmatrix} \frac{\partial^2 f}{\partial x_1^2} & \frac{\partial^2 f}{\partial x_1 \partial x_2} & \frac{\partial^2 f}{\partial x_1 \partial x_n} \\ \frac{\partial^2 f}{\partial x_2 \partial x_1} & \frac{\partial^2 f}{\partial x_2^2} & \frac{\partial^2 f}{\partial x_2 \partial x_n} \\ \vdots & \vdots & \vdots \\ \frac{\partial^2 f}{\partial x_n \partial x_1} & \frac{\partial^2 f}{\partial x_n \partial x_2} & \frac{\partial^2 f}{\partial x_n^2} \end{bmatrix} \in \mathbb{R}^{n \times n}$$

Strict convex $\Leftrightarrow \nabla^2 f(x) \succ 0$
 Concave $\Leftrightarrow \nabla^2 f(x) \preccurlyeq 0$

Quadratic function: $f(x) = \frac{1}{2}x^T Qx + q^T x$

$$\nabla f(x) = Qx + q \quad \nabla^2 f(x) = Q \quad f(x) \text{ is convex} \Leftrightarrow Q \succcurlyeq 0$$

Squared loss: $f(x) = \|Ax - b\|_2^2$

$$\nabla f(x) = 2A^T(Ax - b) \quad \nabla^2 f(x) = 2A^T A \quad f(x) \text{ is convex}$$

Examples

Univariate function:

- Exponential function $f(x) = e^{ax}$, for any a . $f''(x) = a^2 e^{ax} > 0$
- Logarithmic function $f(x) = \log x$ over \mathbb{R}_{++} . $f''(x) = -\frac{1}{x^2} < 0$
- Quadratic function $f(x) = ax^2 + bx + c$, $a > 0$. $f''(x) = a > 0$
- Power function $f(x) = x^a$ is convex for $a \geq 1$ or $a \leq 0$, and is concave for $0 \leq a \leq 1$.
 $f''(x) = a(a-1)x^{a-2}$
- Negative entropy $f(x) = x \log x$. $f'(x) = \log x + 1$ $f''(x) = \frac{1}{x} > 0$

Examples

- Quadratic-over-linear function: $f(x, y) = x^2/y$, where $y > 0$.

$$\nabla^2 f(x) = \begin{bmatrix} \frac{2}{y} & -\frac{2x}{y^2} \\ -\frac{2x}{y^2} & \frac{2x^2}{y^3} \end{bmatrix} = \frac{2}{y^3} \begin{bmatrix} y^2 & -xy \\ -xy & x^2 \end{bmatrix} = \frac{2}{y^3} \begin{bmatrix} y \\ -x \end{bmatrix} \begin{bmatrix} y \\ -x \end{bmatrix}^T \succcurlyeq 0$$

- Norm: $f(x) = \|x\|_p \triangleq (\sum_{i=1}^n |x_i|^p)^{1/p}$, where $p \geq 1$

$$f(\theta x + (1 - \theta)y) \leq f(\theta x) + f((1 - \theta)y) = \theta f(x) + (1 - \theta)f(y)$$

- Max: $f(x) = \max_i x_i$

$$\begin{aligned} f(\theta x + (1 - \theta)y) &= \max_i (\theta x_i + (1 - \theta)y_i) \leq \theta \max_i x_i + (1 - \theta) \max_i y_i \\ &= \theta f(x) + (1 - \theta)f(y) \end{aligned}$$

Restriction to a line

$f: \mathbb{R}^n \rightarrow \mathbb{R}$ is convex if and only if the function $g: \mathbb{R} \rightarrow \mathbb{R}$

$$g(t) = f(x + ty), \text{ dom } g = \{t | x + ty \in \text{dom } f\}$$

is convex in t for any $x \in \text{dom } f$.

Example: Log-determinant. $f: \mathbf{S}_{++}^n \rightarrow \mathbb{R}$, $f(X) = \log \det X$ is concave

$$\begin{aligned} g(t) &= f(X + tV) = \log \det(X + tV) \\ &= \log \det(X^{1/2}IX^{1/2} + tX^{1/2}X^{-1/2}VX^{-1/2}X^{1/2}) \\ &= \log \det(X^{1/2}(I + tX^{-1/2}VX^{-1/2})X^{1/2}) \\ &= 2\log \det(X^{1/2}) + \log \det(I + tX^{-1/2}VX^{-1/2}) \\ &= \log \prod_{i=1}^n (1 + t\lambda_i) + 2\log \det(X^{1/2}) \\ &= \sum_{i=1}^n \log(1 + t\lambda_i) + 2\log \det(X^{1/2}) \end{aligned}$$

Eigenvalue of $X^{-1/2}VX^{-1/2}$

$$g'(t) = \sum_{i=1}^n \frac{\lambda_i}{1 + t\lambda_i} \quad g''(t) = -\sum_{i=1}^n \frac{\lambda_i^2}{(1 + t\lambda_i)^2} < 0$$

Jensen's inequality

Basic: if f is convex, then for any $0 \leq \theta \leq 1$:

$$f(\theta x + (1 - \theta)y) \leq \theta f(x) + (1 - \theta)f(y)$$

Extension to more than two points: if f is convex, then for any $\theta_1, \dots, \theta_k \in [0,1]$ such that $\sum_{i=1}^k \theta_i = 1$

$$f\left(\sum_{i=1}^k \theta_i x_i\right) \leq \sum_{i=1}^k \theta_i f(x_i)$$

Expression with expectation: if f is convex, then:

$$f(E[x]) \leq E[f(x)]$$

Example: $\frac{a+b}{2} \geq \sqrt{ab}$ $f(x) = -\log x$ is convex $\Rightarrow -\log \frac{a+b}{2} \leq -\frac{1}{2}(\log a + \log b)$
i.e., $-\frac{a+b}{2} \geq -\sqrt{ab}$

Sublevel set and epigraph:

t – sublevel set of a function $f: \mathbb{R}^n \rightarrow \mathbb{R}$:

$$C_t = \{x \in \mathbf{dom} f \mid f(x) \leq t\}$$

Sublevel sets of a convex function are convex sets (inverse is false).

A function is quasi-convex if all its sublevel sets are convex.

Epigraph of a function $f: \mathbb{R}^n \rightarrow \mathbb{R}$:

$$\mathbf{epi} f = \{(x, t) \in \mathbb{R}^{n+1} \mid x \in \mathbf{dom} f, f(x) \leq t\}$$

f is convex if and only if $\mathbf{epi} f$ is a convex set

Convexity-preserving operations

- Non-negative weighted sum: let f_1, \dots, f_m be convex functions and $\alpha_1, \dots, \alpha_m \in \mathbb{R}$ be non-negative values. Then the following function is convex:

$$f(x) = \sum_{i=1}^m \alpha_i f_i(x)$$

- Affine composition: let f be a convex function. Then $g(x) \triangleq f(Ax + b)$ is convex

E.g., $f(x) = \|Ax + b\|_2^2$ is convex

Convexity-preserving operations

Composition: let f be the composition of $g: \mathbb{R}^n \rightarrow \mathbb{R}$ and $h: \mathbb{R} \rightarrow \mathbb{R}$,

$$f(x) = h(g(x))$$

- g is **convex** and h is **convex and non-decreasing**: then f is convex.
- g is **concave** and h is **convex and non-increasing**: then f is convex.

Examples:

- $\exp g(x)$ is convex if g is convex.
- $1/g(x)$ is convex if g is concave and positive.

Convexity-preserving operations

Pointwise maximum: if f_1, \dots, f_m are convex function, then

$$f(x) = \max\{f_1(x), \dots, f_m(x)\}$$

is convex

Examples:

- Piecewise-linear function: $f(x) = \max_i (a_i^T x + b_i)$ is convex.
- Sum of r largest components of $x \in \mathbb{R}^n$: let $x_{[1]} \leq x_{[2]} \leq \dots \leq x_{[n]}$. Then

$$f(x) = \sum_{i=1}^r x_{[i]}$$

is convex.

$$\max\{x_{i_1} + x_{i_2} + \dots + x_{i_r} \mid 1 \leq i_1 \leq i_2 \leq \dots \leq i_r\}$$

Sum of any r different components of x is convex function
 \Rightarrow pointwise maximum of them is convex

Convexity-preserving operations

If $f(x, y)$ is convex in x for each $y \in C$, then

$$g(x) = \sup_{y \in C} f(x, y)$$

is convex

Examples:

- Distance to the farthest point of a set: $f(x) = \sup_{y \in S} \|x - y\|$
- Support function of a set: $S_C(x) = \sup_{y \in C} y^T x$

How to verify convexity of a function

- By definition
- Hessian matrix is positive semidefinite
- By convexity-preserving operations

Conjugate function

The conjugate function of a function f is

$$f^*(y) = \sup_{x \in \text{dom } f} y^T x - f(x)$$

The domain of conjugate function is where the supremum is finite.

In one-dimensional space, the conjugate function is the maximum gap between the linear function xy and $f(x)$.

The conjugate function is always convex (pointwise supremum of a family of affine functions)

Conjugate function: examples

- Affine function $f(x) = ax + b$

$$f^*(y) = \sup_{x \in \mathbb{R}} xy - ax - b = b, y = a$$

If $y \neq a$, then $xy - ax - b$ is **unbounded** for $x \in \mathbb{R}$

- Negative logarithmic $f(x) = -\log x$

$$f^*(y) = \sup_{x>0} xy + \log x = -1 - \log(-y), y < 0$$

If $y \geq 0$, then $xy + \log x$ is **unbounded** as $x \rightarrow +\infty$

- Exponential function $f(x) = e^x$

$$f^*(y) = \sup_x xy - e^x = y \log(y) - y, y \geq 0$$

If $y < 0$, then $xy - e^x$ is **unbounded** for $x \rightarrow -\infty$

- Strictly convex quadratic $f(x) = \frac{1}{2}x^T Qx$ with $Q \succ 0$

$$f^*(y) = \sup_x y^T x - \frac{1}{2}x^T Qx = \frac{1}{2}y^T Q^{-1}y, \text{ for all } y$$
